2.2 DISCLAIMER

- He intentado montar una charla útil para principiantes, pero con tips para gente con más conocimientos.
- Espero haberlo conseguido :-)

3 SHELL SCRIPT

3.1 INTRODUCCIÓN

- Un shell script es un fichero de texto con comandos.
- Para ejecutarlo no hay ni que compilar, ni tener nada **instalado**, y puedes utilizar todos los comandos del sistema.
- Usalo para **automatizar tareas del sistema y/o procesar datos** de forma rápida.
- Usalo para hacer **pequeños scripts**, no grandes programas, para eso tienes otros lenguajes.

3.2 HOLA MUNDO

```
#!/bin/bash  
  
# script showing a "Hello world!"  
echo "Hello world!"
```

3.3 PERMISOS

- Antes de ejecutar hay que **darle permisos**, pero recuerda, un gran poder conlleva una gran responsabilidad :-)

```
$ chmod +x 01_hello_world.sh
```

3.4 EJECUCIÓN

- Para ejecutar un script:
 - si está en el \$PATH, el nombre directamente
 - si no, desde la carpeta, ./nombre.sh

```
$ ./01_hello_world.sh
```

`ejemplos/01_hola_mundo.sh`

3.5 NOMBRES

- Estas son mis **reglas de estilo** (en realidad de Google), si no te gustan tengo otras. :-)

```
ficheros_shell_scripts.sh  
VARIABLES_DE_ENTORNO  
variables_locales  
nombres_de_funciones
```

3.6 INICIO

- Es una buena práctica **empezar los shells scripts así:**

```
#!/bin/bash

# Short description of the script

set -o errexit # the script ends if a command fails
set -o pipefail # the script ends if a command fails in a pipe
set -o nounset # the script ends if it uses an undeclared variable
# set -o xtrace # if you want to debug
```

3.7 EXIT

- Es una buena práctica terminar los shells scripts con un código de retorno:
 - **mayor de 0** si ha habido un error
 - **igual a 0** si termina correctamente (si no pones 'exit')

```
#!/bin/bash

num_params=$#

if [ $num_params -lt 1 ]; then
    echo "At least one parameter must be introduced."
    exit 1 # error and exits with a return code > 0
fi

echo "All ok" # ok and exits with a return code = 0
```

3.8 PARCIALES

- Podemos guardar el resultado de la ejecución de comandos en variables:

```
date=$(date +%Y-%m-%d %H:%M:%S)
```

3.9 FUNCIONES

- Es una buena práctica asignar los **parámetros de la función** al principio ya sean como variables locales o, si es necesario, globales.

```
my_function() {  
    local function_param_1="$1"      # 1st param assigned as local  
    global_param_2=${2:-default}     # 2nd param assigned as global (default)  
    local function_num_params=$#     # numbers of params assigned as local  
    local all_function_params=($@)   # all params assigned as a local  
}
```

```
my_function function_param_1 function_param_2 ... function_param_N
```

3.10 PARÁMETROS

- Los parámetros los cogemos de la línea de comandos cuando ejecutamos.

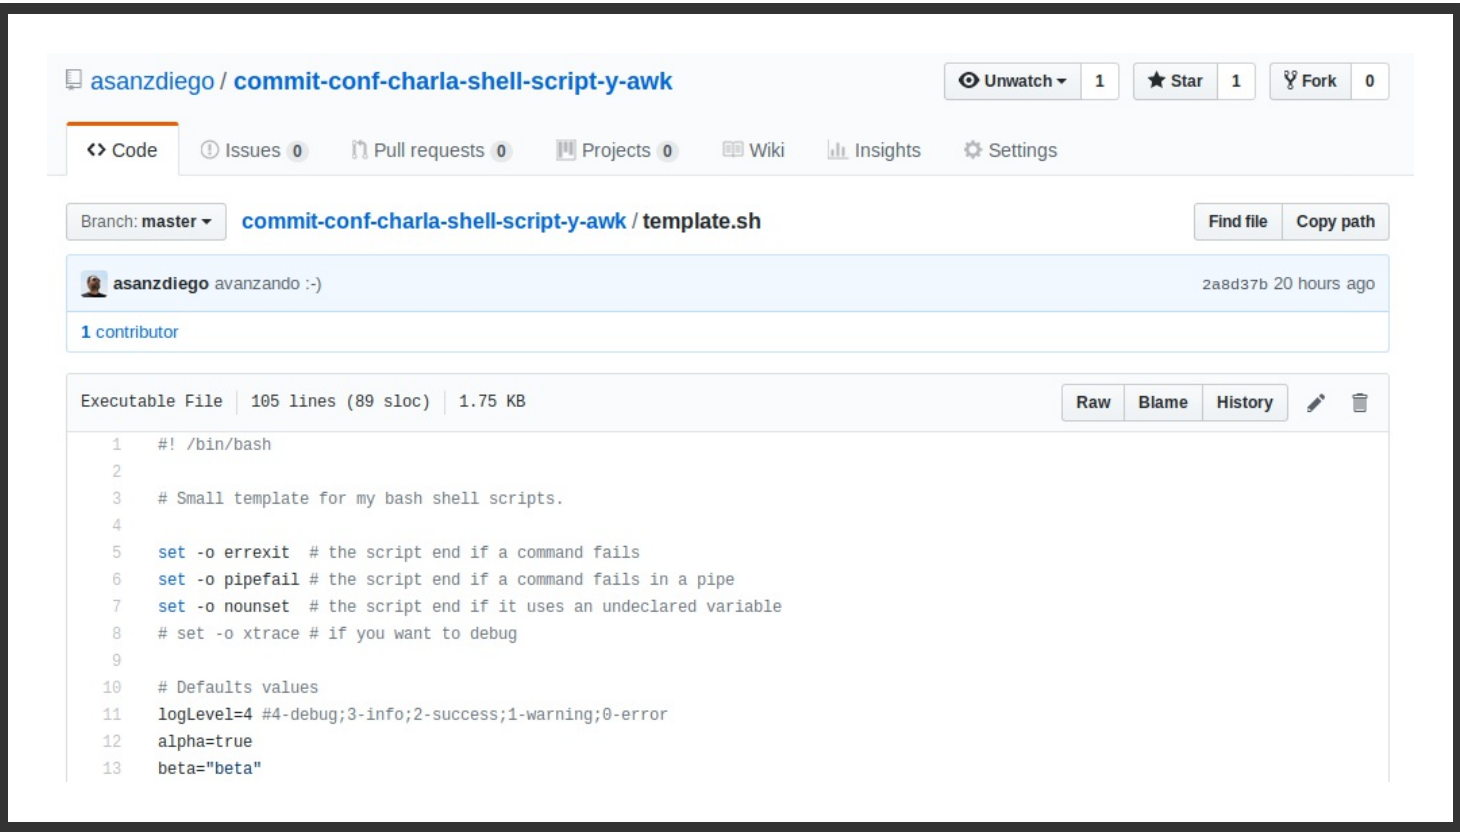

```
# Default values
default_2="Commit Conf"

param_1=$1 # the first script param
param_2=${2:-${default_2}} # the second script param (with default value)
num_params=$# # the numbers of script params
all_params=($@) # all params assigned as an array
```

```
$ ./02_parameters.sh param_1 param_2 ... param_N
```

3.13 SHELLCHECK

ShellCheck - A shell script static analysis tool

ShellCheck is a GPLv3 tool that gives warnings and suggestions for bash/sh shell scripts:

```
vidar@vidarholen ~$ shellcheck myscript

In myscript line 7:
if (( $n > 3.5 ))
    ^-- Don't use $ on variables in (( )),
    ^-- (( )) doesn't support decimals, Use bc or awk.

In myscript line 16:
[[ $1 == $result ]] && mode=lookup
    ^-- Quote the rhs of = in [[ ]] to prevent glob interpretation.

vidar@vidarholen ~$
```

The goals of ShellCheck are

- To point out and clarify typical beginner's syntax issues that cause a shell to give cryptic error messages.
- To point out and clarify typical intermediate level semantic problems that cause a shell to behave strangely and counter-intuitively.
- To point out subtle caveats, corner cases and pitfalls that may cause an advanced user's otherwise working script to fail under future circumstances.

See [the gallery of bad code](#) for examples of what ShellCheck can help you identify!

Bash Shell Scripting Definition

Bash

Bash is a command language interpreter. It is widely available on various operating systems and is a default command interpreter on most GNU/Linux systems. The name is an acronym for the 'Bourne-Again SHell'.

Shell

Shell is a macro processor which allows for an interactive or non-interactive command execution.

Scripting

Scripting allows for an automatic commands execution that would otherwise be executed interactively one-by-one.

Bash Shell Script Basics

Do not despair if you have not understood any of the above **Bash Shell Scripting** definitions. It is perfectly normal, in fact, this is precisely why you are reading this Bash Scripting tutorial.

What is Shell

Most likely, your are at the moment sitting in front of your computer, have a terminal window opened and wondering: "What should I do with this thing?"

Well, the terminal window in front of you contains **shell**, and shell allows you by use of commands to interact with your computer, hence retrieve or store data, process information and various other simple or even extremely complex tasks.

4 AWK

4.1 INTRODUCCIÓN

- Es una hoja de cálculo por línea de comandos.
- Tiene su propio lenguaje que es muy parecido a C.
- Muy útil para procesar datos dentro de un shell script.
- Muy útil para hacer cosas raras con datos y que con una hoja de cálculo normal es difícil de hacer.
- Muy útil cuando hay muchos datos y una hoja de cálculo se queda colgada.

4.2 EJECUCIÓN

```
awk 'awk_program' data_file
```

```
awk -f 'awk_program' data_file
```

4.3 GRADES

- Sacar las medias de los alumnos:

Pepito	4.4	3.1	5.7
Fulanito	4.2	6.5	8.8
Menganito	5.6	5.0	5.3

```
awk '{ print $1"="($2+$3+$4)/3 }' 03_grades.csv
```

`ejemplos/04_grades.sh`

4.4 ROLES

- Agrupar por rol:

```
Pepito:Jefe,Sistemas  
Fulanito:Jefe,Desarrollo  
Menganito:Operario,Sistemas,Desarrollo
```

```
Sistemas -> Menganito Pepito  
Operario -> Menganito  
Jefe -> Fulanito Pepito  
Desarrollo -> Menganito Fulanito
```

4.5 SIN AWK

```
roles_file=./05_roles.csv

roles=$(cut -d : -f 2 $roles_file | sed 's/,/\n/g' | sort | uniq)

for rol in $roles; do
    echo -n "${rol} -> "
    echo $(grep -E "${rol}" "${roles_file}" | cut -d : -f 1)
done
```

[ejemplos/06_roles_sin_awk.sh](#)

4.6 CON AWK

```
# this will run only once at first
BEGIN { FS = ",|:" }
# this will be executed for each of the lines in the file
{
    name=$1
    for (i=2; i<=NF; i++) {
        roles[$i]=roles[$i]" "old_names
    }
}
# This will only run once at the end
END {
    for (rol in roles) {
        print rol" -> " roles[rol]
    }
}
done
```
